Add Next/Previous Links to Blogs

[Original RFE](#)

Tiki's blogs are great. (You can read my Tiki blog, [here](#). But one thing that it is missing is an easy way for readers "page" through the posts.

The **tiki_view_blog_page** lists several posts per page. But what I *really* want is 1__ post at a time... *in addition to* the ability to see multiple posts per page.

Look at how a Wordpress blog does it:

Listing the previous and next posts in the blog.

'd love to have something similar on my **tiki view blog post** pages. It doesn't seem too hard... I can get a list of all posts in a specific blog, I just can't figure out how to iterate through the array to determine which post is "next" and which is "previous".... can **you**?
